# CMPE1300 – Exercise 13

You will write a program that will create an array of integers, and fill the array with random numbers in the range of 0 to 100. The program will then perform the following operations on the array:

- Use an integer version of GetValue() to input the size of the array to be created.
- Fill the array with random integers in the range of 0 to 100 inclusive.
- Display the values in the array on one line separated by a comma and a space.
- Find and display the smallest value in the array.
- Determine the number of values in the array that are less than 50.
- Using a loop construct, display the contents of the array in reverse separated by a comma and a space.

The main program will run in a loop allowing the user to run it over again.
